CS3217

Final Project

Name

Startup Weekend Singapore

Total Score: **92** /100

Grade: **A+**

Item	Score	Remarks
Proposal	5 /5	
Preliminary Design Document	15 /15	
Progress Report 2	15 /15	
Team Presentation	8 /10	
STePS	3 /5	
Final Review	10 /10	
Final Report	36 /40	I don't think it is a big mistake to design based of a local database. The network storage component if properly designed should abstract this from you. In any case, any issues would be one arising from scalability which is normal for any rapidly prototyped app like yours. End of the day, it was not properly developing the network storage that screwed you over. Other teams have managed to write an abstraction layer over Firebase so I do not think it is that big an issue.
Comments		I was quite impressed with the final app, after having seen the state of it at the last project meeting. With the exception of a few components, notably the data/network storage and notification service, the system is well designed and engineered. There is no lack of features to be implemented and you have made good use of this to showcase the engineering for example with reusable UI elements and ViewControllers.
